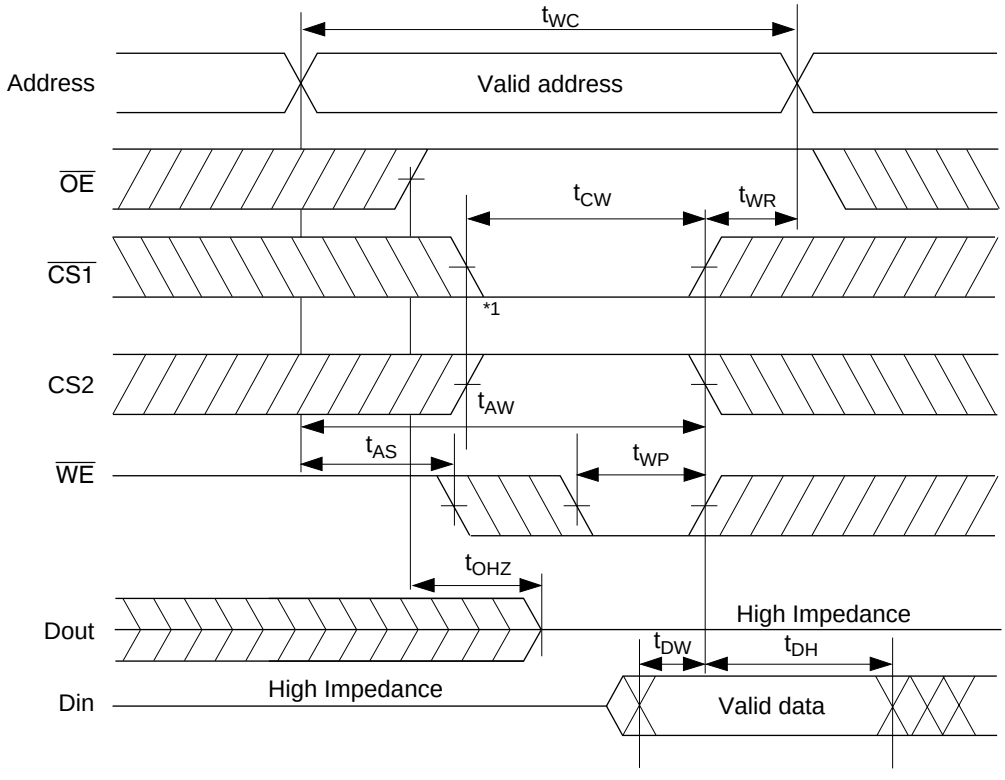
Notes:
1. A write occurs during the overlap of a low $\overline{CS1}$, and high CS2, and a high $\overline{WE}$. A write begins at the latest transition among $\overline{CS1}$ going low,CS2 going high and $\overline{WE}$ going low. A write ends at the earliest transition among $\overline{CS1}$ going high CS2 going low and $\overline{WE}$ going high. Time t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from the later of $\overline{CS1}$ going low or CS2 going high to the end of write.
3. t_{AS} is measured from the address valid to the beginning of write.
4. t_{WR} is measured from the earliest of $\overline{CS1}$ or $\overline{WE}$ going high or CS2 going low to the end of write cycle.
5. During this period, I/O pins are in the output state, therefore the input signals of the opposite phase to the outputs must not be applied.
6. In the write cycle with $\overline{OE}$ low fixed, t_{WP} must satisfy the following equation to avoid a problem of data bus contention

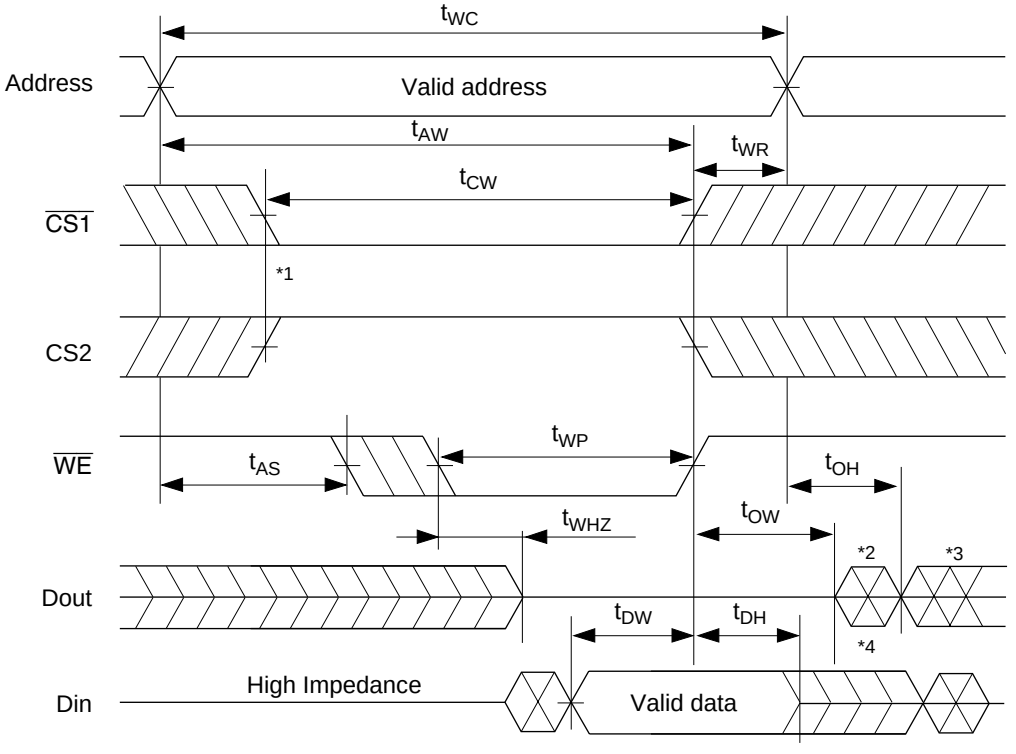
   $t_{WP} \geq t_{WHZ}$ max + t_{DW} min.

Write Timing Waveform (1) ($\overline{OE}$ Clock)



Note: 1. If $\overline{CS1}$ goes low or CS2 goes high simultaneously with $\overline{WE}$ going low or after $\overline{WE}$ going low, the outputs remain in the high impedance state.

Write Timing Waveform (2) ($\overline{OE}$ Low Fixed) ($\overline{OE}$ = V_{IL})



Notes:
1. If $\overline{CS1}$ goes low simultaneously with $\overline{WE}$ going low or after $\overline{WE}$ goes low, the outputs remain in high impedance state.
2. Dout is the same phase of the written data in this write cycle.
3. Dout is the read data of the next address.
4. If $\overline{CS1}$ is low and CS2 is high during this period, I/O pins are in the output state. Input signals of opposite phase to the outputs must not be applied to I/O pins.

Low V_{CC} Data Retention Characteristics (Ta = 0 to +70°C)

Parameter	Symbol	Min	Typ[*1]	Max	Unit	Test conditions[*4]
V_{CC} for data retention	V_{DR}	2.0	—	—	V	$\overline{CS1} \geq V_{CC} - 0.2$ V, CS2 ≥ V_{CC} –0.2 V or CS2 ≤ 0.2 V
Data retention current	I_{CCDR}	—	1[*1]	25[*2]	µA	V_{CC} = 3.0 V, 0 V ≤ Vin ≤ V_{CC} $\overline{CS1} \geq V_{CC}$ –0.2 V, CS2 ≥ V_{CC} –0.2 V or 0 V ≤ CS2 ≤ 0.2 V
Chip deselect to data retention time	t_{CDR}	0	—	—	ns	See retention waveform
Operation recovery time	t_R	t_{RC}[*3]	—	—	ns	

Notes: 1. Reference data at Ta = 25°C.
2. 10 µA max at Ta = 0 to + 40°C.
3. t_{RC} = read cycle time.
4. CS2 controls address buffer, $\overline{WE}$ buffer, $\overline{CS1}$ buffer, $\overline{OE}$ buffer, and Din buffer. If CS2 controls data retention mode, Vin levels (address, $\overline{WE}$, $\overline{OE}$, $\overline{CS1}$, I/O) can be in the high impedance state. If $\overline{CS1}$ controls data retention mode, CS2 must be CS2 ≥ V_{CC} – 0.2 V or 0 V ≤ CS2 ≤ 0.2 V. The other input levels (address, $\overline{WE}$, $\overline{OE}$, I/O) can be in the high impedance state.
