

## SA7025 <br> Low-voltage 1GHz fractional-N synthesizer

## DESCRIPTION

The SA7025 is a monolithic low power, high performance dual frequency synthesizer fabricated in QUBiC BiCMOS technology. Featuring Fractional-N division with selectable modulo 5 or 8 implemented in the Main synthesizer to allow the phase detector comparison frequency to be five or eight times the channel spacing. This feature reduces the overall division ratio yielding a lower noise floor and faster channel switching. The phase detectors and charge pumps are designed to achieve phase detector comparison frequencies up to 5 MHz . A triple modulus prescaler (divide by 64/65/72) is integrated on chip with a maximum input frequency of 1.04 GHz . Programming and channel selection are realized by a high speed 3 -wire serial interface.

## FEATURES

- Operation up to 1.04 GHz
- Fast locking by "Fractional-N" divider
- Auxiliary synthesizer
- Digital phase comparator with proportional and integral charge pump output
- High speed serial input
- Low power consumption
- Programmable charge pump currents
- Supply voltage range 2.7 to 5.5 V
- Excellent input sensitivity: $\mathrm{V}_{\text {RF_IN }}=-20 \mathrm{dBm}$

APPLICATIONS

- NADC (North American Digital Cellular)
- PDC (Personal Digital Cellular)
- Cellular radio
- Spread-spectrum receivers

## PIN CONFIGURATION

Figure 1. Pin Configuration

## ORDERING INFORMATION

| DESCRIPTION | TEMPERATURE RANGE | ORDER CODE | DWG \# |
| :---: | :---: | :---: | :---: |
| 20-Pin Plastic Shrink Small Outline Package (SSOP) | -40 to $+85^{\circ} \mathrm{C}$ | SA7025DK | SOT266-1 |

## ABSOLUTE MAXIMUM RATINGS

| SYMBOL | PARAMETER | RATING | UNITS |
| :---: | :--- | :---: | :---: |
| V | Supply voltage, $\mathrm{V}_{\mathrm{DD}}, \mathrm{V}_{\mathrm{DDA}}, \mathrm{V}_{\mathrm{CCP}}$ | -0.3 to +6.0 | V |
| $\mathrm{~V}_{\mathrm{IN}}$ | Voltage applied to any other pin | -0.3 to $\left(\mathrm{V}_{\mathrm{DD}}+0.3\right)$ | V |
| $\mathrm{T}_{\mathrm{STG}}$ | Storage temperature range | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{A}}$ | Operating ambient temperature range | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Thermal impedance $\left(\theta_{J A}\right)=117^{\circ} \mathrm{C} / \mathrm{W}$. This device is ESD sensitive.

## PIN DESCRIPTIONS

| Symbol | Pin | Description |
| :---: | :---: | :---: |
| CLOCK | 1 | Serial clock input |
| DATA | 2 | Serial data input |
| STROBE | 3 | Serial strobe input |
| $\mathrm{V}_{\text {SS }}$ | 4 | Digital ground |
| RFin | 5 | Prescaler positive input |
| $\overline{\mathrm{RF} \text { IN }}$ | 6 | Prescaler negative input |
| $\mathrm{V}_{\text {CCP }}$ | 7 | Prescaler positive supply voltage. This pin supplies power to the prescaler and RF input buffer |
| REF ${ }_{\text {IN }}$ | 8 | Reference divider input |
| RA | 9 | Auxiliary current setting; resistor to $\mathrm{V}_{\text {SSA }}$ |
| $A^{\prime} X_{\text {IN }}$ | 10 | Auxiliary divider input |
| PHA | 11 | Auxiliary phase detector output |
| $\mathrm{V}_{\text {SSA }}$ | 12 | Analog ground |
| PHI | 13 | Integral phase detector output |
| PHP | 14 | Proportional phase detector output |
| $\mathrm{V}_{\text {DDA }}$ | 15 | Analog supply voltage. This pin supplies power to the charge pumps, Auxiliary prescaler, Auxiliary and Reference buffers. |
| RN | 16 | Main current setting; resistor to $\mathrm{V}_{\text {SSA }}$ |
| RF | 17 | Fractional compensation current setting; resistor to $\mathrm{V}_{\text {SSA }}$ |
| LOCK | 18 | Lock detector output |
| TEST | 19 | Test pin; connect to $\mathrm{V}_{\mathrm{DD}}$ |
| $\mathrm{V}_{\mathrm{DD}}$ | 20 | Digital supply voltage. This pin supplies power to the CMOS digital part of the device |

## BLOCK DIAGRAM

## AC ELECTRICAL CHARACTERISTICS

$V_{D D}=V_{D D A}=V_{C C P}=3 V ; T_{A}=25^{\circ} \mathrm{C} ; \mathrm{f}_{R F \_} / \mathrm{N}=1 \mathrm{GHz}$, input level $=-20 \mathrm{dBm}$; unless otherwise specified. Test Circuit, Figure 4. The parameters listed below are tested using automatic test equipment to assure consistent electrical characteristics. The limits do not represent the ultimate performance limits of the device. Use of an optimized RF layout will improve many of the listed parameters.

| SYMBOL | PARAMETER | TEST CONDITIONS | LIMITS |  |  | UNITS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## AC ELECTRICAL CHARACTERISTICS (continued)

| SYMBOL | PARAMETER | TEST CONDITIONS | LIMITS |  |  | UNITS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | MIN | TYP | MAX |  |
| tsw | Pulse width; STROBE | A word, $\mathrm{PR}=$ ' 01 ' | $\frac{1}{f_{\mathrm{VCO}}} \cdot(\mathrm{NM} 2 \cdot 65)+\mathrm{t}_{\mathrm{w}}$ |  |  | ns |
|  |  | A word, $\mathrm{PR}={ }^{\text {' }} 10$ ' | $\frac{1}{\mathrm{f}_{\mathrm{VCO}}} \cdot[(\mathrm{NM2} 2 \cdot 65)+(\mathrm{NM3}+1) \cdot 72]+\mathrm{t}_{\mathrm{W}}$ |  |  |  |

NOTES:

1. When a serial input " $A$ " word is programmed, the main charge pumps on PHP and PHI are in the "speed up mode" as long as STROBE = H . When this is not the case, the main charge pumps are in the "normal mode".
2. The relative output current variation is defined thus:

$$
\frac{\Delta \mathrm{I}_{\mathrm{OUT}}}{\mathrm{I}_{\mathrm{OUT}}}=2 \cdot \frac{\left(\mathrm{I}_{2}-\mathrm{I}_{1}\right)}{\left|\left(\mathrm{I}_{2}+\mathrm{I}_{1}\right)\right|} ; \text { with } \mathrm{V}_{1}=0.7 \mathrm{~V}, \mathrm{~V}_{2}=\mathrm{V}_{\mathrm{DDA}}-0.8 \mathrm{~V} \text { (see Figure 3). }
$$

3. $\mathrm{F}_{\mathrm{RD}}$ is the value of the 3 bit fractional accumulator.
4. Monotonicity is guaranteed with $\mathrm{C}_{\mathrm{N}}=0$ to 255 .
5. Power supply current measured with $\mathrm{V}_{\mathrm{DD}}=\mathrm{V}_{\mathrm{CCP}}=3 \mathrm{~V}, \mathrm{~V}_{\mathrm{DDA}}=5 \mathrm{~V}, \mathrm{f}_{\mathrm{RF} I \mathrm{~N}}=915.99 \mathrm{MHz}, \mathrm{XTAL}$ at $21.36 \mathrm{MHz}, \mathrm{AUX}$ at $85.92 \mathrm{MHz}\left(\mathrm{PA}={ }^{\text {' } 0 \text { ' }) \text {, }}\right.$

Main comp frequency $=240 \mathrm{kHz}$, Auxiliary comp frequency $=120 \mathrm{kHz}, \mathrm{CN}=160, \mathrm{CL}=0, \mathrm{CK}=0$. Internal registers $\mathrm{NM} 1=52, \mathrm{NM} 2=0$,
$\mathrm{NM} 3=4, \mathrm{PR}=' 10$ ', $\mathrm{SM}={ }^{\prime} 00^{\prime}, \mathrm{SA}={ }^{\prime} 01$ ', $\mathrm{NA}=179, \mathrm{NF}=5, \mathrm{FMOD}=8, \mathrm{NR}=89, \mathrm{PA}=0, \operatorname{IRN}=\operatorname{IRA}=\mathrm{IRF}=25 \mu \mathrm{~A}$, lock condition, normal mode. Operational supply current $=I_{D D A}+I_{D D}+I_{C C P}$.
6. Specification condition: $\mathrm{CN}=255$
7. Specification conditions:

1) $C N=255 ; C L=1$, or
2) $C N=75 ; C L=3$
8. Typical output current $\left|I_{\text {PHI }}\right|=-I_{\text {RN }} \times C N \times 2(C L+1) \times C K / 32$ :
1) $C N=160 ; C L=3 ; C K=1$, or
2) $C N=160 ; C L=2 ; C K=2$, or
3) $C N=160 ; C L=1 ; C K=4$, or
4) $C N=160 ; C L=0 ; C K=8$
9. Any RFD, $\mathrm{CL}=1$ for speed-up pump. The integral pump is intended for switching only and the fractional compensation is not guaranteed.
10. Specification conditions: $\mathrm{F}_{\mathrm{RD}}=1$ to $7 ; \mathrm{CL}=1$.
11. Specification conditions:
1) $F_{R D}=1$ to $7 ; C L=1 ; C K=2$, or
2) $F_{R D}=1$ to $7 ; C L=2 ; C K=1$.
12. The matching is defined by the sum of the $P$ and the $N$ pump for a given output voltage.
13. Limited analog supply voltage range 4.5 to 5.5 V .
14. For $\mathrm{f}_{\mathrm{IN}}<50 \mathrm{MHz}$, low frequency operation requires DC-coupling and a minimum input slew rate of $32 \mathrm{~V} / \mathrm{\mu s}$.
15. Guaranteed by design.
16. Close in noise for the charge pumps is tested on a sample basis in a typical application in order to eliminate parts outside the normal distribution.
17. $\mathrm{F}_{\mathrm{XTAL}}=14.4 \mathrm{MHz}, \mathrm{V}_{\mathrm{XTAL}}=500 \mathrm{mV}$ P-p, comparison frequency $=200 \mathrm{kHz}$, Loop bandwidth $=5 \mathrm{kHz}$, Audio filter $=300 \mathrm{~Hz}$ to 15 kHz .

## AC TIMING CHARACTERISTICS

SR00604
Figure 5. Serial Input Timing Sequence

## FUNCTIONAL DESCRIPTION

## Serial Input Programming

The serial input is a 3 -wire input (CLOCK, STROBE, DATA) to program all counter ratios, DACs, selection and enable bits. The programming data is structured into 24 or 32 bit words; each word includes 1 or 4 address bits. Figure 5 shows the timing diagram of the serial input. When the STROBE $=\mathrm{L}$, the clock driver is enabled and on the positive edges of the CLOCK the signal on DATA input is clocked into a shift register. When the STROBE $=\mathrm{H}$, the clock is disabled and the data in the shift register remains stable. Depending on the 1 or 4 address bits the data is latched into different working registers or temporary registers. In order to fully program the synthesizer, 4 words must be sent: D, C, B and A. Figure 6 and Table 1 shows the format and the contents of each word. The E word is for testing purposes only. The E (test) word is reset when programming the D word. The data for CN and PR is stored by the B word in temporary registers. When the A word is loaded, the data of these temporary registers is loaded together with the A word into the work registers which avoids false temporary main divider input. CN is only loaded from the temporary registers when a short 24 bit AO word is used. CN will be directly loaded by programming a long 32 bit A1 word. The flag LONG in the D word determines whether A0 (LONG = "0") or A1 (LONG = " 1 ") format is applicable. The A word contains new data for the main divider.

## Main Divider Synchronization

The A word is loaded only when a main divider synchronization signal is also active in order to avoid phase jumps when reprogramming the main divider. The synchronization signal is generated by the main divider. The signal is active while the NM1 divider is counting down from the programmed value. The new A word will be loaded after the NM1 divider has reached its terminal count; also, at this time a main divider output pulse will be sent to the main phase detector. The loading of the A word is disabled while the NM2 or NM3 dividers are counting up to their programmed
values. Therefore, the new A word will be correctly loaded provided that the STROBE signal has been at an active high value for at least a minimum number of VCO input cycles at $\mathrm{RF}_{\text {IN }}$ or $\mathrm{RF}_{\text {IN }}$.

$$
\begin{aligned}
& t \text { _strobe_min }=\frac{1}{f_{\mathrm{VCO}}}\left(\mathrm{NM}_{2} \cdot 65\right)+\mathrm{t}_{\mathrm{W}} \text { for } \mathrm{PR}={ }^{\prime} 01^{\prime} \\
& t \text { _strobe_min }=\frac{1}{f_{\mathrm{VCO}}}\left[\mathrm{NM}_{2} \cdot 65+\left(\mathrm{NM}_{3}+1\right) \cdot 72\right]+\mathrm{t}_{\mathrm{W}} \text { for } \mathrm{PR}={ }^{\prime} 10^{\prime}
\end{aligned}
$$

Programming the A word means also that the main charge pumps on output PHP and PHI are set into the speed-up mode as long as the STROBE is H .

## Auxiliary Divider

The input signal on AUX_IN is amplified to logic level by a single-ended CMOS input buffer, which accepts low level AC coupled input signals. This input stage is enabled if the serial control bit EA = "1". Disabling means that all currents in the input stage are switched off. A fixed divide by 4 is enabled if $\mathrm{PA}=$ " 0 ". This divider has been optimized to accept a high frequency input signal. If $P A=$ " 1 ", this divider is disabled and the input signal is fed directly to the second stage, which is a 12 -bit programmable divider with standard input frequency ( 40 MHz ). The division ratio can be expressed as:

$$
\begin{aligned}
& \text { if } P A=\text { " } 0 \text { ": } N=4 \times N A \\
& \text { if } P A=\text { " } 1 \text { ": } N=N A \text {; with } N A=4 \text { to } 4095
\end{aligned}
$$

## Reference Divider

The input signal on REF_IN is amplified to logic level by a single-ended CMOS input buffer, which accepts low level AC coupled input signals. This input stage is enabled by the OR function of the serial input bits EA and EM. Disabling means that all currents in the input stage are switched off. The reference divider consists of a programmable divider by NR ( $N R=4$ to 4095) followed by a three bit binary counter. The 2 bit SM register (see Figure 7) determines which of the 4 output pulses is selected as the main

## 1GHz low-voltage Fractional-N synthesizer

phase detector input. The 2 bit SA register determines the selection of the auxiliary phase detector signal.

## Main Divider

The differential inputs are amplified (to internal ECL logic levels) and provide excellent sensitivity $(-20 \mathrm{dBm}$ at 1 GHz$)$ making the prescaler ideally suited to directly interface to a VCO as integrated on the SA620 RF gain stage, VCO and mixer device. The internal triple modulus prescaler feedback loop FB controls the selection of the divide by ratios 64/65/72, and reduces the minimum system division ratio below the typical value required by standard dual modulus (64/65) devices.
This input stage is enabled when serial control bit EM = "1". Disabling means that all currents in the prescaler are switched off.
The main divider is built up by a 12 bit counter plus a sign bit. Depending on the serial input values NM1, NM2, NM3, and the prescaler select PR, the counter will select a prescaler ratio during a number of input cycles according to Table 2 and Table 3.
The loading of the work registers NM1, NM2, NM3 and PR is synchronized with the state of the main counter, to avoid extra phase disturbance when switching over to another main divider ratio as explained in the Serial Input Programming section.

At the completion of a main divider cycle, a main divider output pulse is generated which will drive the main phase comparator. Also, the fractional accumulator is incremented with NF. The
accumulator works modulo $Q$. $Q$ is preset by the serial control bit FMOD to 8 when $\mathrm{FMOD}=$ " 1 ". Each time the accumulator overflows, the feedback to the prescaler will select one cycle using prescaler ratio R2 instead of R1.
As shown above, this will increase the overall division ratio by 1 if $R 2=R 1+1$. The mean division ratio over $Q$ main divider will then be

$$
N Q=N+\frac{N F}{Q}
$$

Programming a fraction means the prescaler with main divider will divide by N or $\mathrm{N}+1$. The output of the main divider will be modulated with a fractional phase ripple. This phase ripple is proportional to the contents of the fractional accumulator FRD, which is used for fractional current compensation.

## Phase Detectors

The auxiliary and main phase detectors are a two D-type flip-flop phase and frequency detector shown in Figure 8. The flip-flops are set by the negative edges of output signals of the dividers. The rising edge of the signal, L, will reset the flip-flops after both flip-flops have been set. Around zero phase error this has the effect of delaying the reset for 1 reference input cycle. This avoids non-linearity or deadband around zero phase error. The flip-flops drive on-chip charge pumps. A source current from the charge pump indicates the VCO frequency will be increased; a sink current indicates the VCO frequency will be decreased.

Figure 6. Serial Input Word Format

## Current Settings

The SA7025 has 3 current setting pins: RA, RN and RF. The active charge pump currents and the fractional compensation currents are linearly dependent on the current connected between the current setting pin and $\mathrm{V}_{\text {SS }}$. The typical value R (current setting resistor) can be calculated with the formula:

$$
R=\frac{V_{D D A}-0.9-150 \sqrt{I_{R}}}{I_{R}}
$$

The current can be set to zero by connecting the corresponding pin to $V_{\mathrm{DDA}}$.

## Auxiliary Output Charge Pumps

The auxiliary charge pumps on pin PHA are driven by the auxiliary phase detector and the current value is determined by the external resistor RA at pin RA. The active charge pump current is typically:

$$
\left|I_{\mathrm{PHA}}\right|=8 \cdot I_{\mathrm{RA}}
$$

## Main Output Charge Pumps and Fractional Compensation Currents

The main charge pumps on pin PHP and PHI are driven by the main phase detector and the current value is determined by the current at pin RN and via a number of DACs which are driven by registers of the serial input. The fractional compensation current is determined by the current at pin RF, the contents of the fractional accumulator FRD and a number of DACs driven by registers from the serial input. The timing for the fractional compensation is derived from the reference divider. The current is on during 1 input reference cycle before and 1 cycle after the output signal to the phase comparator. Figure 9 shows the waveforms for a typical case.

## Table 1. Function Table

| Symbol | Bits | Function |
| :---: | :---: | :---: |
| NM1 | 12 | Number of main divider cycles when prescaler modulus $=64{ }^{\text {* }}$ |
| NM2 | $\begin{aligned} & 8 \text { if } \mathrm{PR}=" 01 ", \\ & 4 \text { if } \mathrm{PR}=" 10 \text { " } \end{aligned}$ | Number of main divider cycles when prescaler modulus $=65^{*}$ |
| NM3 | 4 if PR = " 10 " | Number of main divider cycles when prescaler modulus $=72^{*}$ |
| PR | 2 | Prescaler type in use <br> PR = "01": modulus 2 prescaler (64/65) <br> PR = "10": modulus 3 prescaler (64/65/72) |
| NF | 3 | Fractional-N increment |
| FMOD | 1 | Fractional-N modulus selection flag "1": modulo 8 "0": modulo 5 |
| LONG | 1 | A word format selection flag "0": 24 bit A0 format <br> "1": 32 bit A1 format |
| CN | 8 | Binary current setting factor for main charge pumps |
| CL | 2 | Binary acceleration factor for proportional charge pump current |
| CK | 4 | Binary acceleration factor for integral charge pump current |
| EM | 1 | Main divider enable flag |
| EA | 1 | Auxiliary divider enable flag |
| SM | 2 | Reference select for main phase detector |
| SA | 2 | Reference select for auxiliary phase detector |
| NR | 12 | Reference divider ratio |
| NA | 12 | Auxiliary divider ratio |
| PA | 1 | Auxiliary prescaler mode: <br> PA = "0": divide by 4 <br> PA = "1": divide by 1 |
| *Not including reset cycles and Fractional-N effects. |  |  |

Figure 7. Reference Divider
Table 2. Prescaler Ratio
The total division ratio from prescaler to the phase detector may be expressed as:

| if PR = "01" | $\begin{aligned} & \mathrm{N}=(\mathrm{NM} 1+2) \times 64+\mathrm{NM} 2 \times 65 \\ & \left.\mathrm{~N}^{\prime}=(\mathrm{NM} 1+1) \times 64+(\mathrm{NM} 2+1) \times 65 \text { (}^{*}\right) \end{aligned}$ |
| :---: | :---: |
| if PR = "10" | $\begin{aligned} & \hline N=(N M 1+2) \times 64+\text { NM2 } \times 65+(\mathrm{NM} 3+1) \times 72 \\ & \left.N^{\prime}=(\mathrm{NM} 1+1) \times 64+(\mathrm{NM} 2+1) \times 65+(\mathrm{NM} 3+1) \times 72 \text { (*) }^{( }\right) \end{aligned}$ |

Table 3. PR Modulus

| PR | Modulus Prescaler | Bit Capacity |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | NM1 | NM2 | NM3 |
| 01 | 2 | 12 | 8 | - |
| 10 | 3 | 12 | 4 | 4 |

When the serial input A word is loaded, the output circuits are in the "speed-up mode" as long as the STROBE is H, else the "normal mode" is active. In the "normal mode" the current output PHP is:

$$
I_{\text {PHP_N }}=I_{\text {PHP }}+I_{\text {PHP_comp }}
$$

where:

$$
\begin{aligned}
& \left|I_{\text {PHP }}\right|=\frac{C N \cdot I_{R N}}{32} \quad \text { charge pump current } \\
& \left|I_{\text {PHP_comp }}\right|=F R D \cdot \frac{I_{R F}}{128}: \begin{array}{c}
\text { fractional comp. } \\
\text { current }
\end{array}
\end{aligned}
$$

The current in PHI is zero in "normal mode".
In "speed-up mode" the current in output PHP is:

$$
\begin{aligned}
& I_{\text {PHP_S }}=I_{\text {PHP }}+I_{\text {PHP_comp }} \\
& \left|I_{\text {PHP }}\right|=\left(\frac{C N \cdot I_{R N}}{32}\right)\left(2^{C L+1}+1\right) \\
& \left|I_{\text {PHP_comp }}\right|=\left(\frac{F R D \cdot I_{R F}}{128}\right)\left(2^{\mathrm{CL}+1}+1\right)
\end{aligned}
$$

In "speed-up mode" the current in output PHI is:
$I_{\text {PHI_S }}=I_{\text {PHI }}+I_{\text {PHI_comp }}$
where:

$$
\begin{aligned}
& \left|\mathrm{I}_{\mathrm{PH}}\right|=\left(\frac{\mathrm{I}_{\mathrm{RN}} \mathrm{CN}}{32}\right)\left(2^{\mathrm{CL}+1}\right) \mathrm{CK} \\
& \mathrm{I}_{\mathrm{PH} \_ \text {comp }} \mathrm{l}=\left(\frac{\mathrm{I}_{\mathrm{RF}} \mathrm{FRD}}{128}\right)\left(2^{\mathrm{CL}+1}\right) \mathrm{CK}
\end{aligned}
$$

Figure 9 shows that for proper fractional compensation, the area of the fractional compensation current pulse must be equal to the area of the charge pump ripple output. This means that the current setting on the input RN, RF is approximately:

$$
\frac{I_{R N}}{I_{R F}}=\frac{\left(Q \cdot f_{V C O}\right)}{\left(3 \cdot C N \cdot F_{\text {INR }}\right)}
$$

where:

$$
\begin{array}{ll}
\mathrm{Q}= & \text { fractional- } \mathrm{N} \text { modulus } \\
\mathrm{f}_{\mathrm{VCO}}=\mathrm{f}_{\mathrm{INM}} \times \mathrm{N}, & \text { input frequency of the prescaler } \\
\mathrm{F}_{\text {INR }}= & \text { input frequency of the reference divider }
\end{array}
$$

PHI pump is meant for switching only. Current and compensation are not as accurate as PHP.

Figure 8. Phase Detector Structure with Timing

Figure 9. Waveforms for $\mathrm{NF}=2$, Fraction $=0.4$

## Lock Detect

The output LOCK is H when the auxiliary phase detector AND the main phase detector indicates a lock condition. The lock condition is defined as a phase difference of less than +1 cycle on the reference input REF_IN. The lock condition is also fulfilled when the relative counter is disabled ( $\mathrm{EM}=$ " 0 " or respectively $\mathrm{EA}=$ " 0 ") for the main, respectively auxiliary counter.

## Test Modes

The lock output is selectable as $f_{\text {REF }}, f_{A U X}, f_{\text {MAIN }}$ and lock. Bits T1 and T0 of the E word control the selection (see Figures 6 and 10).
If $\mathrm{T} 1=\mathrm{T} 0=$ Low, or if the E -word is not sent, the lock output is configured as the normal lock output described in the Lock Detect section.

If T1 = Low and T0 = High, the lock output is configured as $f_{\text {REF }}$. The signal is the buffered output of the reference divider NR and the 3 -bit binary counter SM. The fref signal appears as normally low and pulses high whenever the divider reaches terminal count from the value programmed into the NR and SM registers. The f feF signal can be used to verify the divide ratio of the Reference divider.
If $\mathrm{T} 1=$ High and $\mathrm{T} 0=$ Low, the lock output is configured as $\mathrm{f}_{\mathrm{AUX}}$. The signal is normally high and pulses low whenever the divider reaches terminal count from the value programmed into the NA and

PA registers. The $f_{A U X}$ signal can be used to verify the divide ratio of the Auxiliary divider.
If $\mathrm{T} 1=$ High and T0 $=$ High, the lock output is configured as $\mathrm{f}_{\text {MAIN }}$. The signal is the buffered output of the MAIN divider. The $\mathrm{f}_{\text {MAIN }}$ signal appears as normally high and pulses low whenever the divider reaches terminal count from the value programmed into the NM1, NM2 or NM3 registers. The $f_{\text {MAIN }}$ signal can be used to verify the divide ratio of the MAIN divider and the prescaler.

## Test Pin

The Test pin, Pin 19, is a buffered logic input which is exclusively ORed with the output of the prescaler. The output of the XOR gate is the input to the MAIN divider. The Test pin must be connected to $\mathrm{V}_{\mathrm{DD}}$ during normal operation as a synthesizer. This pin can be used as an input for verifying the divide ratio of the MAIN divider; while in this condition the input to the prescaler, $\mathrm{RF}_{\mathrm{IN}}$, may be connected to $\mathrm{V}_{\mathrm{CCP}}$ through a $10 \mathrm{k} \Omega$ resistor in order to place prescaler output into a known state.
