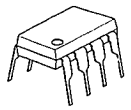
SINGLE-SUPPLY DUAL OPERATIONAL AMPLIFIER

■ GENERAL DESCRIPTION

The NJM2904 consists of two independent, high gain, internally frequency compensated operation amplifiers which were designed specifically to operate from a single power suppply over a wide range of voltages. Operation from split power supplies is also possible and the low power supply current drain is independent of the magnitude of the power supply voltage.

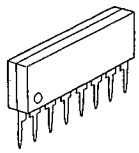
Application areas include transducer amplifiers, DC gain blocks, and all the conventional op amp circuits which now can be more easily implemented in single power supply systems. For example, the NJM2904 can be directly operated off of the standard +5V power supply voltage which is used in digital systems and will easily provide the required interface electronics without requiring the additional ± 15V power supplies.

■ PACKAGE OUTLINE

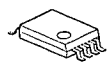


NJM2904D

NJM2904M



NJM2904L

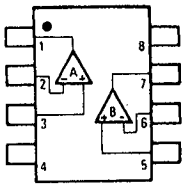


NJM2904V

■ FEATURES

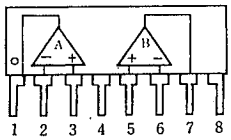
- Single Supply
- Operating Voltage (+3V～+32V)
- Low Operating Current (0.7mA typ.)
- Slew Rate (0.5V/ μs typ.)
- Bipolar Technology
- Package Outline DIP8, DMP8, SIP8, SSOP8

■ PIN CONFIGURATION



NJM2904D
NJM2904M
NJM2904V

PIN FUNCTION
1. A OUTPUT
2. A−INPUT
3. A+INPUT
4. GND
5. B+INPUT
6. B−INPUT
7. B OUTPUT
8. V+



NJM2904L

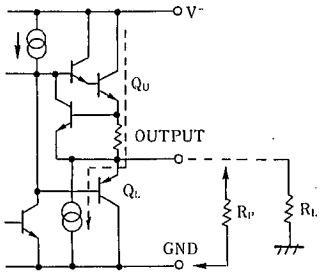
■ APPLICATION

• Improvement of Cross-over Distortion

Equivalent circuit at the output stage



NJM2904, in its static state (No in and output condition) when design, Q_U being biassed by constant current (breake down beam) yet, Q_L stays OFF.

While using with both power soure mode, the cross-over distortion might occure instantly when Q_L ON.

There might be cases when application for amplifier of audio signals, not only distortion but also the apparent frequency bandwidth being narrowed remarkably.

It is aduisable especially when using both power soure mode, constantly to use with higher current on Q_U than the load current (including feedback current), and then connect the pull-down resister RP at the part between output and GND pins.
