

GENERAL DESCRIPTION

The AK5357 is a stereo A/D Converter with wide sampling rate of 4kHz ~ 96kHz and is suitable for multimedia audio system. The AK5357 achieves high accuracy and low cost by using Enhanced dual bit $\Delta\Sigma$ techniques. The AK5357 requires no external components because the analog inputs are single-ended. The audio interface has two formats (MSB justified, I^2S) and can correspond to many systems like Karaoke, surround.

FEATURES

- Stereo $\Delta\Sigma$ ADC
- On-Chip Digital Anti-Alias Filtering
- Single-ended Input
- Digital HPF for DC-Offset cancel
- S/(N+D): 88dB@5V, 86dB@3V for 48kHz
- DR: 102dB@5V, 100dB@3V for 48kHz
- S/N: 102dB@5V, 100dB@3V for 48kHz
- Sampling Rate Ranging from 4kHz to 96kHz
- Master Clock:
 - 256fs/384fs/512fs/768fs (4kHz ~ 48kHz)
 - 256fs/384fs (48kHz ~ 96kHz)
- Input level: TTL/CMOS selectable
- Master / Slave Mode
- Audio Interface: 24bit MSB justified / I^2S selectable
- Power Supply: 2.7 ~ 5.5V
- Ta = -40 ~ 85°C (VT), -20 ~ 85°C (ET)
- Small 16pin TSSOP Package
- AK5381 Pin-compatible

OPERATION OVERVIEW

■ System Clock

MCLK (256fs/384fs/512fs), SCLK and LRCK (fs) clocks are required in slave mode. The LRCK clock input must be synchronized with MCLK, however the phase is not critical. Table 1 shows the relationship of typical sampling frequency and the system clock frequency. MCLK frequency, SCLK frequency, HPF (ON or OFF), the input level (CMOS or TTL) and master/slave are selected by CKS2-0 pins as shown in Table 2.

All external clocks (MCLK, SCLK and LRCK) must be present unless PDN pin = "L". If these clocks are not provided, the AK5357 may draw excess current due to its use of internal dynamically refreshed logic. If the external clocks are not present, place the AK5357 in power-down mode (PDN pin = "L"). In master mode, the master clock (MCLK) must be provided unless PDN pin = "L".

fs	MCLK

Table 2. Mode Select

Note: SDTO outputs 16bit data at SCLK=32fs.

■ Audio Interface Format

Two kinds of data formats can be chosen with the DIF pin (Table 3). In both modes, the serial data is in MSB first, 2's compliment format. The SDTO is clocked out on the falling edge of SCLK. The audio interface supports both master and slave modes. In master mode, SCLK and LRCK are output with the SCLK frequency fixed to 64fs and the LRCK frequency fixed to 1fs.

1	H	24bit, I ² S Compatible	L/H	≥ 48fs or 32fs	Figure 2

Table 3. Audio Interface Format

Figure 1. Mode 0 Timing

Figure 2. Mode 1 Timing

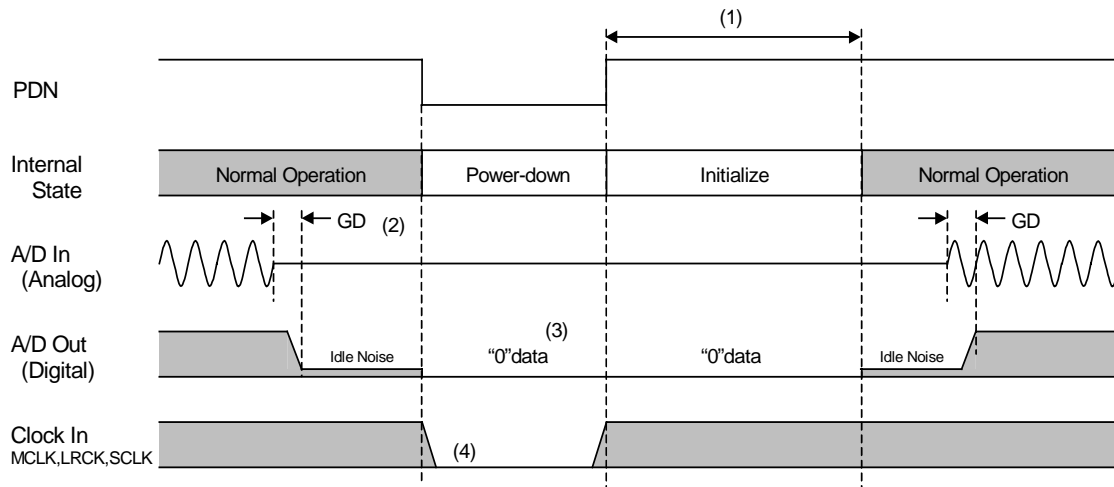

■ Digital High Pass Filter

The ADC has a digital high pass filter for DC offset cancellation. The cut-off frequency of the HPF is 1.0Hz (@fs=48kHz) and scales with sampling rate (fs).

HPF is controlled by CKS2-0 pins (Table 2). If HPF setting (ON/OFF) is changed at operating, click noise occurs by changing DC offset. It is recommended that HPF setting is changed at PDN pin = "L".

■ Power down

The AK5357 is placed in the power-down mode by bringing PDN pin “L” and the digital filter is also reset at the same time. This reset should always be done after power-up. In the power-down mode, the VCOM are AGND level. An analog initialization cycle starts after exiting the power-down mode. Therefore, the output data SDTO becomes available after 4129 cycles of LRCK clock in master mode or 4132 cycles of LRCK clock in slave mode. During initialization, the ADC digital data outputs of both channels are forced to a 2’s complement “0”. The ADC outputs settle in the data corresponding to the input signals after the end of initialization (Settling approximately takes the group delay time).

Notes:

- (1) 4132/fs in slave mode and 4129/fs in master mode.
- (2) Digital output corresponding to analog input has the group delay (GD).
- (3) A/D output is “0” data at the power-down state.
- (4) When the external clocks (MCLK, SCLK, LRCK) are stopped, the AK5357 should be in the power-down state.

Figure 3. Power-down/up sequence example

■ System Reset

The AK5357 should be reset once by bringing PDN pin “L” after power-up. In slave mode, the internal timing starts clocking by the rising edge (falling edge at mode 1) of LRCK after exiting from reset and power down state by MCLK. The AK5357 is power down state until LRCK is input. In master mode, the internal timing starts when MCLK is input.

SYSTEM DESIGN

Figure 4 shows the system connection diagram. An evaluation board is available which demonstrates application circuits, the optimum layout, power supply arrangements and measurement results.

Note:

- AGND and DGND of the AK5357 should be distributed separately from the ground of external digital devices (MPU, DSP etc.).
- All digital input pins should not be left floating.
- The CKS1 pin should be connected to VA or AGND.

Figure 4. Typical Connection Diagram

Figure 5. Ground Layout

Note:

- AGND and DGND must be connected to the same analog ground plane.

1. Grounding and Power Supply Decoupling

The AK5357 requires careful attention to power supply and grounding arrangements. Alternatively if VA and VD are supplied separately, the power up sequence is not critical. **AGND and DGND of the AK5357 must be connected to analog ground plane.** System analog ground and digital ground should be connected together near to where the supplies are brought onto the printed circuit board. Decoupling capacitors should be as near to the AK5357 as possible, with the small value ceramic capacitor being the nearest.

2. Voltage Reference

The voltage input to VA sets the analog input range. VCOM are 50% VA and normally connected to AGND with a 0.1 μ F ceramic capacitor. A ceramic capacitor 0.47 μ F attached to VCOM pin eliminates the effects of high frequency noise. No load current may be drawn from these pins. All signals, especially clocks, should be kept away from the VCOM pin in order to avoid unwanted coupling into the AK5357.

3. Analog Inputs

The ADC inputs are single-ended and internally biased to the common voltage (50% VA) with 20k Ω (typ@fs=48kHz) resistance. The input signal range scales with the supply voltage and nominally 0.6xVA Vpp (typ). The ADC output data format is 2's complement. The DC offset is removed by the internal HPF.

The AK5357 samples the analog inputs at 64fs. The digital filter rejects noise above the stop band except for multiples of 64fs. The AK5357 includes an anti-aliasing filter (RC filter) to attenuate a noise around 64fs.
