LINEAR INTEGRATED CIRCUIT

2A, 24V, 1.4MHz STEP-DOWN CONVERTER

DESCRIPTION

The UTC **UD24202** is a monolithic step-down switching mode converter with a built-in power MOSFET. It regulates input voltages from 4.5V to 24V down to an output voltage as low as 0.83V, and supplies up to 2A of load current.

Current mode operation provides fast transient response and eases loop stabilization. Fault condition protection includes cycle-by-cycle current limiting and thermal shutdown.

The UTC **UD24202** requires a minimum number of readily available standard external components.

PIN CONFIGURATION

PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	BST	High-Side Gate Drive Boost Input. BS supplies the drive for the high-side N-Channel MOSFET switch. Connect a 0.01 μ F or greater capacitor from SW to BST to power the high side switch.
2	GND	Ground.
3	FB	Feedback. An external resistor divider from the output to GND, tapped to the FB pin sets the output voltage. To prevent current limit run away during a short circuit fault condition, the frequency foldback comparator lowers the oscillator frequency when the FB voltage is below 250mV.
4	EN	On/Off Control Input. Pull EN above 1.2V to turn the device on. For automatic enable, connect a 100k Ω resistor between this pin and Vin pin.
5	V _{IN}	Supply Voltage. The UD24202 operates from a +4.5V to +24V unregulated input. C1 is needed to prevent large voltage spikes from appearing at the input.
6	SW	Power Switching Output. SW is the switching node that supplies power to the output. Connect the output LC filter from SW to the output load. Note that a capacitor is required from SW to BS to power the high-side switch.
