

High Performance Broadband Mixers

api
technologies corp.

API Technologies hybrid mixer product line covers frequency ranges from 0.5 MHz to 26.5 GHz

Available in many industry standard surface mount, drop-in and connectorized housings, these mixers are ideal for high reliability applications. API Technologies mixers are offered in both double or triple balanced configurations for broad frequency coverage. Additionally, other diode-based versions include frequency doublers to 20 GHz, Image Reject and I/Q Modulators to 16 GHz.

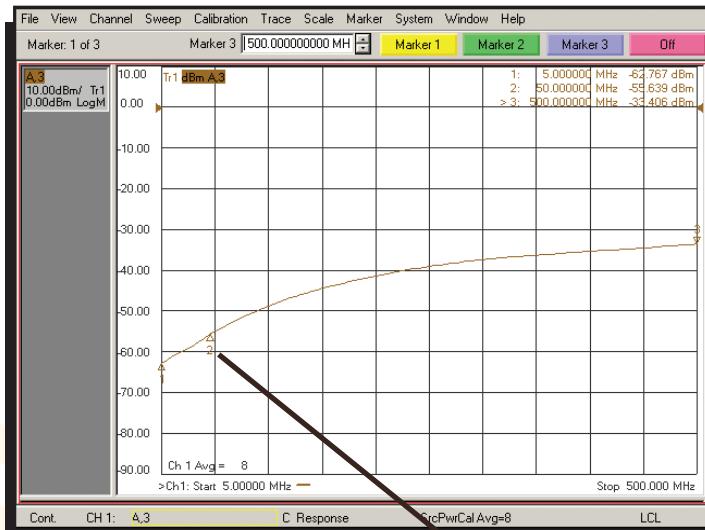

Integral to finding solutions to frequency conversion applications is the ability to not only test for compliance, but to recommend the optimum solution. We conduct a range of environmental tests to help us identify potential problems and recommend appropriate solutions. Our environmental chambers and diverse array of test equipment allow us to conduct these tests in-house providing for a faster turnaround of your complete design solution.

API Technologies applies the principles of its own Quality Management System to deliver the world class quality and consistency our military and commercial customers demand. The efficiencies gained from our manufacturing procedures enable us to cost effectively produce small quantities of custom mixers, along with high volume runs of our standard mixer lines. We carefully monitor critical phases of the production process with data logging technology and utilize our in-house testing capabilities from design through full production. The end result is a quality system worthy of our ISO9001:2000 certification.

| Doubled Balanced Designs |

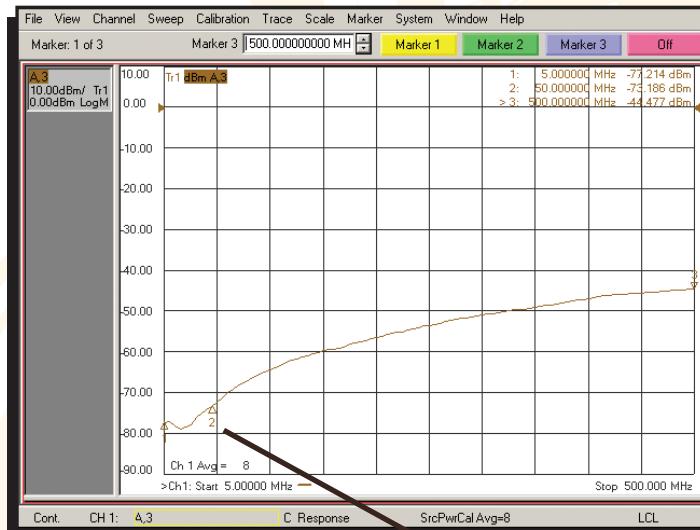

API Technologies' Double Balanced Mixers employ a single quad diode ring with two broadband baluns, one for the modulating signal (applied to the RF or IF port) and one for the carrier signal (applied to the LO port).

Excellent LO to IF Isolation through the use of matched diode selection

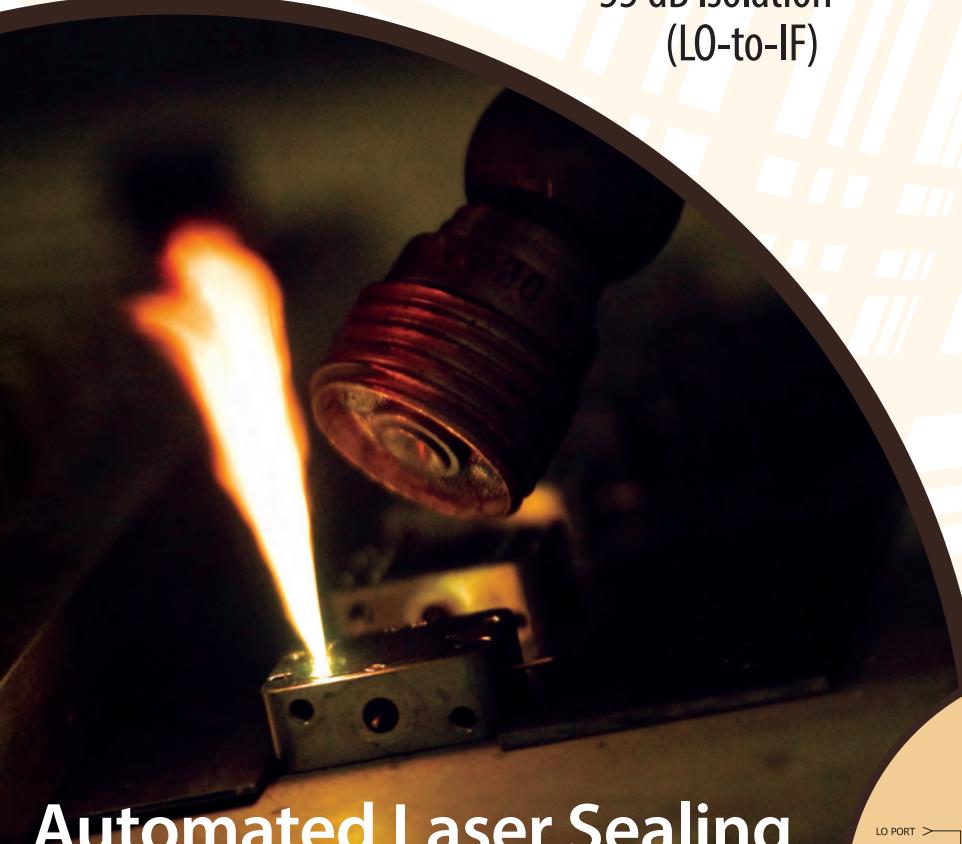

55 dB Isolation
(LO-to-IF)

Superior LO to RF Isolation through strict line length symmetry

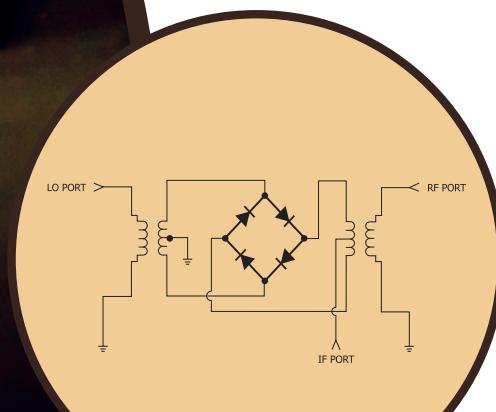

73 dB Isolation
(LO-to-RF)

Automated Laser Sealing

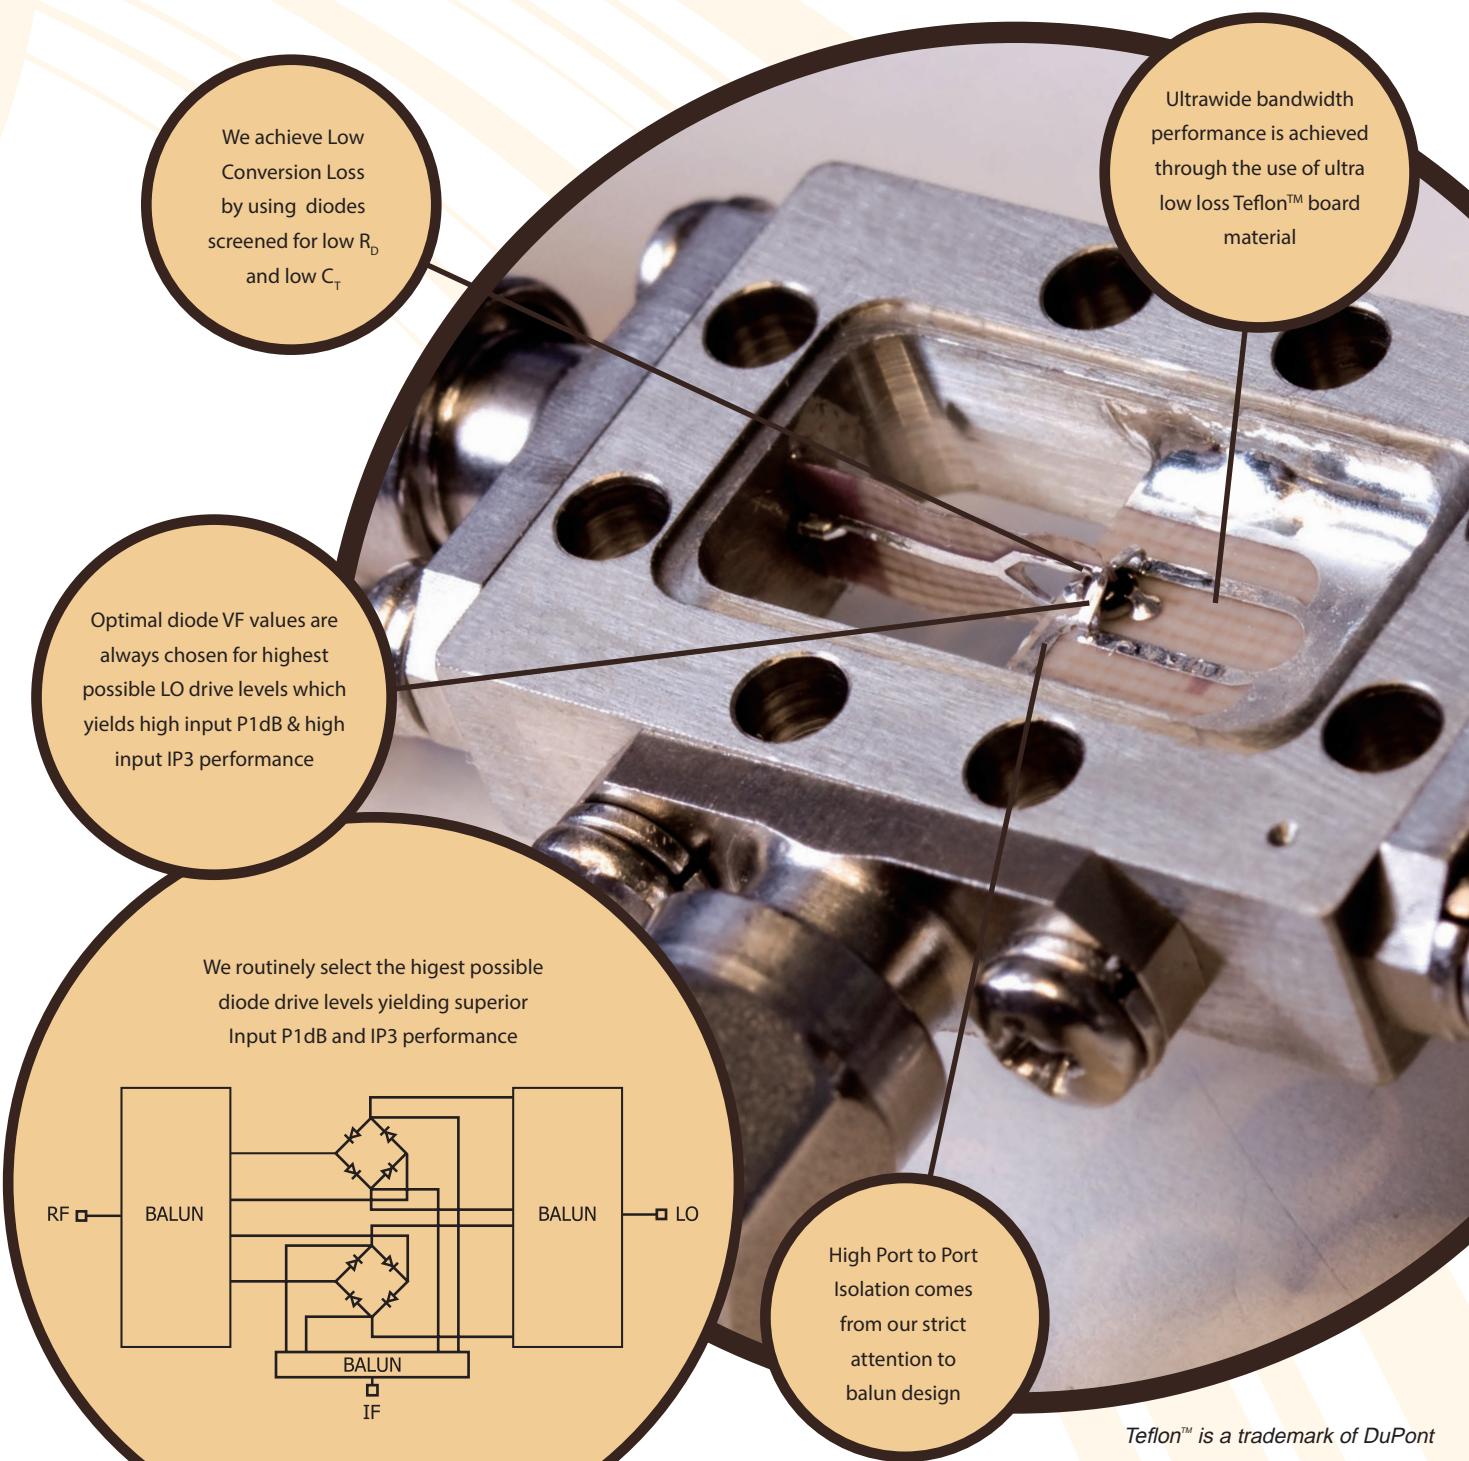

Unlike other mixer companies, API Technologies routinely laser welds its mixers for **improved hermeticity and environmental integrity**.

- Double Balanced Mixers feature a DC coupled output port (either RF or IF) for mixing applications requiring baseband frequency coverage, phase detection, or bi-phase modulation.
- By design, the modulating signal and the output signal may not overlap, allowing the balun structures to act as filters and improve port-to-port isolation.
- Single diode quads handle LO drive levels of more than +19 dBm, delivering input 1 dB compression of +12 dBm and input third order intercept points of +22 dBm.

| Triple Balanced Designs |

Using a more complex RF structure, API Technologies' Triple Balanced Mixers feature a pair of quad diode rings and balun structures on all three ports of the mixers. Choosing Triple Balanced Mixers provides wider operating frequency bandwidths, overlapping RF and IF frequency ranges, and higher available LO drive levels of up to +23 dBm. Operating at the higher LO drive results in higher input 1dB compression levels of +15 dBm and input 3rd order intercept points of +26 dBm. Video feedthru is significantly reduced as the balun structures exhibit high pass filter responses, stopping all low frequency signals.

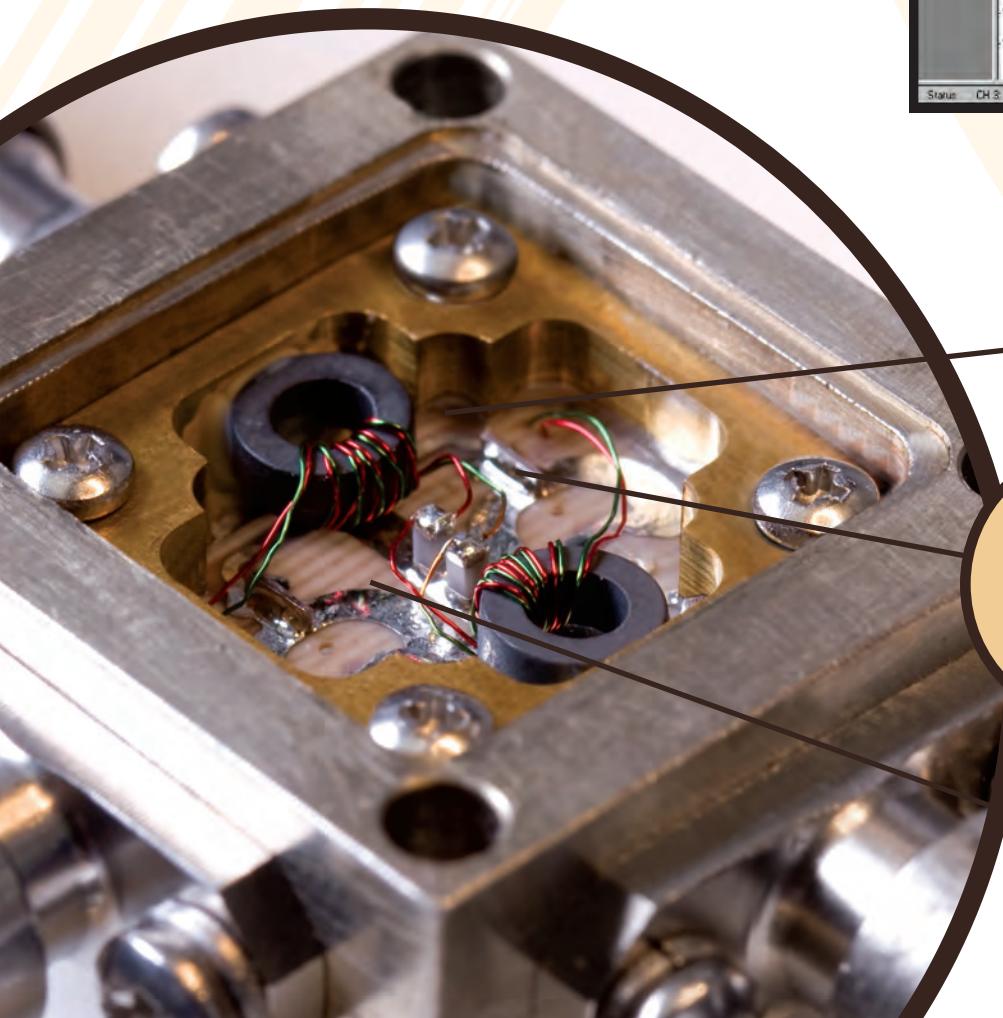

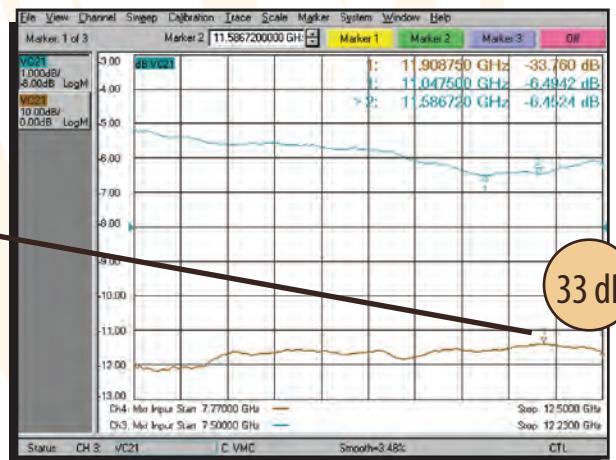

| Image Reject / IQ Designs |

Undesired noise and signals exhibiting a frequency offset from the LO identical to the desired RF signal corrupt the desired conversion in the form of image distortion. API Technologies' Image Reject mixers minimize the impact of image noise on the system noise figure compared to the SSB performance. Our Image Reject mixers also suppress by 25 dB the spurious products generated by undesired signals falling in the system's image frequency range. API's IQ Mixers solve another challenging system problem by resolving the phase of the incoming signal in 90° increments. Subsequent processing of the IQ output allows the system designer to determine whether the RF signal is on the high or low side of the LO frequency.

High Image Suppression (33 dB) and Low Conversion Loss (6.4 dB)

The key to the amount of image suppression obtained with an IQ mixer is determined by the design's amplitude & phase balance. API engineers concentrate on maintaining optimal symmetry in order to obtain the high image suppression needed in today's demanding systems.

| Doublers |

API Technologies' multi-octave spanning Frequency Doublers extend the useful range of lower frequency signal sources. Maximizing the second harmonic of the input signal and minimizing the fundamental and third order products eases the burden on subsequent filtering. Our engineers designed these doublers to be easily dropped into existing oscillator designs providing a tremendous advantage to system designers.

- Quarter wavelength stubs are used to provide diode ground paths and optimize Return Loss
- Synthesized input and output matching networks maintain maximum response flatness across the performance band

The company also focuses its attention on details such as keeping SSB noise low through the use of carefully selected diode bridge quads for low R_D .

With frequency doublers in multi-octave designs from 5 MHz to 10 GHz, API engineers know isolation is a key parameter in doubler performance. With all of their standard doublers delivering 25 dB of isolation, it is no wonder API Technologies is the vendor of choice for engineers who want the best performance as well as the best value.

API Technologies' design engineers focus their expertise not only on meeting the customer's requirements, but on exceeding their expectations. Other companies talk about technology. The performance of API Technologies' designs speak for themselves.

Unlike some other mixer manufacturers who are reluctant to accept specifications requiring guaranteed performance, API actively pursues those requirements, suitable for lab environments as well as extreme temperature environments.

Ultra-Broadband Mixers

| Model Numbers | RF | Frequency (GHz) | | IF | LO Power (dBm) | CL (dB) | Input P1dB (dBm) | Input IP3 (dBm) | Package Style |

micro.apitech.com

API Technologies' website features complete information on all standard products with updated versions of more than 900 product datasheets. API's customers enjoy FREE engineering tools, tours, application notes, white papers, and the ability to create a custom designed product per individual specifications.

Cascade Design Suite

With over 750 datasheets on API Technologies' Amplifiers, Mixers, Oscillators & Control Products, this CD also offers the industry's best manufacturer's cross reference. The System Simulator lets you optimize your design by viewing an individual component's contribution to overall system performance. You can also quickly evaluate trade-offs in component selection and their impact on system performance (e.g. Gain, Noise, P1dB, IP3, Dynamic Range,.....)

api
technologies corp.

API Technologies Corp. is a trusted provider of RF/microwave, microelectronics, and security solutions for critical and high-reliability applications. The company designs, develops and manufactures electronic components, modules, systems and products for technically demanding defense, commercial/industrial and aerospace applications. API Technologies' customers include many leading Fortune 500 companies, as well as a majority of NATO governments. While API was founded in 1981, our heritage brands have served the demanding, hi-rel marketplace for more than 60 years. API Technologies trades on the NASDAQ under the symbol ATNY.
